FLOWER CARE

TROUBLESHOOTING

If your flowers still need some help after carefully following our flower prep guide and letting them hydrate, they are not goners. We'll just have to give them the floral version of avocado toast to help de-grump.

- For wilting flowers, snip the stem again about an inch or two higher, place in lukewarm water and allow to hydrate again. Try some floral food to give them a shot of glucose to perk them up.
- For hydrangea - submerge completely in water for about 30 minutes, shake out to dry, recut and place stem back in water.
- Brown or Bruised petals happen, especially on white petals. Pluck these off or trim off affected areas with scissors. You want to do this as soon as you see bruising (or when you unpackaged) to prevent the spread.

Things to remember:

- Not every flower will be perfect and a loss of 1-3 stems/blooms per bunch or a 3-5% loss per bunch is normal. We do not refund for normal discrepancies.
- Flowers, as with any natural product, may have variations in color, size, fragrance, etc. We in no way guarantee any given shade, tint, or hue of any color. We can't control nature.
- If there is a delay in your shipment, the flowers are not dead and usually perk up with some hydration!
